#### Netflix intro

What data should we encode about each Netflix account holder to help us make effective recommendations?

In machine learning, clustering can be used to group similar data for prediction and recommendation. For example, each Netflix user's viewing history can be represented as a n-tuple indicating their preferences about movies in the database, where n is the number of movies in the database. People with similar tastes in movies can then be clustered to provide recommendations of movies for one another. Mathematically, clustering is based on a notion of distance between pairs of n-tuples.

### Data types

Term	Examples:		
	(add additional examples from class)		
set	$7 \in \{43, 7, 9\}$	$2 \notin \{43, 7, 9\}$	
unordered collection of elements			
repetition doesn't matter			
Equal sets agree on membership of all elements			
n-tuple			
ordered sequence of elements with $n$ "slots" $(n > 0)$			
repetition matters, fixed length			
Equal n-tuples have corresponding components equal			

#### string

ordered finite sequence of elements each from specified set repetition matters, arbitrary finite length Equal strings have same length and corresponding characters equal

#### Special cases:

When n = 2, the 2-tuple is called an **ordered pair**.

A string of length 0 is called the **empty string** and is denoted  $\lambda$ .

A set with no elements is called the **empty set** and is denoted  $\{\}$  or  $\emptyset$ .

#### Set operations

To define a set we can use the roster method, set builder notation, a recursive definition, and also we can apply a set operation to other sets.

New! Cartesian product of sets and set-wise concatenation of sets of strings

**Definition**: Let X and Y be sets. The **Cartesian product** of X and Y, denoted  $X \times Y$ , is the set of all ordered pairs (x, y) where  $x \in X$  and  $y \in Y$ 

$$X \times Y = \{(x, y) \mid x \in X \text{ and } y \in Y\}$$

**Definition**: Let X and Y be sets of strings over the same alphabet. The **set-wise concatenation** of X and Y, denoted  $X \circ Y$ , is the set of all results of string concatenation xy where  $x \in X$  and  $y \in Y$ 

$$X \circ Y = \{xy \mid x \in X \text{ and } y \in Y\}$$

**Pro-tip**: the meaning of writing one element next to another like xy depends on the data-types of x and y. When x and y are strings, the convention is that xy is the result of string concatenation. When x and y are numbers, the convention is that xy is the result of multiplication. This is (one of the many reasons) why is it very important to declare the data-type of variables before we use them.

Fill in the missing entries in the table:

${f Set}$	Example elements in this set:		
В	A C G U		
	(A,C) $(U,U)$		
$B \times \{-1, 0, 1\}$			
$\{-1,0,1\} \times B$			
	(0, 0, 0)		
$\{\mathtt{A},\mathtt{C},\mathtt{G},\mathtt{U}\} \circ \{\mathtt{A},\mathtt{C},\mathtt{G},\mathtt{U}\}$			
	GGGG		
-			

# **Defining functions**

**New! Defining functions** A function is defined by its (1) domain, (2) codomain, and (3) rule assigning each element in the domain exactly one element in the codomain.

The domain and codomain are nonempty sets.

The rule can be depicted as a table, formula, or English description.

The notation is

"Let the function FUNCTION-NAME: DOMAIN  $\rightarrow$  CODOMAIN be given by FUNCTION-NAME(x) = ... for every  $x \in DOMAIN$ ".

or

"Consider the function FUNCTION-NAME: DOMAIN  $\rightarrow$  CODOMAIN given by FUNCTION-NAME(x) = ... for every  $x \in DOMAIN$ ".

Example: The absolute value function

Domain

Codomain

Rule

#### Defining functions recursively

When the domain of a function is a recursively defined set, the rule assigning images to domain elements (outputs) can also be defined recursively.

Recall: The set of RNA strands S is defined (recursively) by:

Basis Step:  $A \in S, C \in S, U \in S, G \in S$ 

Recursive Step: If  $s \in S$  and  $b \in B$ , then  $sb \in S$ 

where sb is string concatenation.

**Definition** (Of a function, recursively) A function rnalen that computes the length of RNA strands in S is defined by:

 $rnalen: S \rightarrow \mathbb{Z}^+$ 

Basis Step: If  $b \in B$  then rnalen(b) = 1Recursive Step: If  $s \in S$  and  $b \in B$ , then rnalen(sb) = 1 + rnalen(s)

The domain of rnalen is

The codomain of rnalen is

Example function application:

$$rnalen(ACU) =$$

Extra example: A function basecount that computes the number of a given base b appearing in a RNA strand s is defined recursively: fill in codomain and sample function applications

$$basecount: S \times B \rightarrow \\ Basis \ Step: \qquad If \ b_1 \in B, b_2 \in B \qquad basecount(b_1,b_2) \qquad = \begin{cases} 1 & \text{when } b_1 = b_2 \\ 0 & \text{when } b_1 \neq b_2 \end{cases} \\ Recursive \ Step: \qquad If \ s \in S, b_1 \in B, b_2 \in B \quad basecount(sb_1,b_2) \qquad = \begin{cases} 1 + basecount(s,b_2) & \text{when } b_1 = b_2 \\ basecount(s,b_2) & \text{when } b_1 \neq b_2 \end{cases}$$

basecount(ACU, A) =

basecount(ACU, G) =

Extra example: The function which outputs  $2^n$  when given a nonnegative integer n can be defined recursively, because its domain is the set of nonnegative integers.

#### Why represent numbers

Positional representation.

Computers.

# Base expansion definition

**Definition** For b an integer greater than 1 and n a positive integer, the base b expansion of n is

$$(a_{k-1}\cdots a_1a_0)_b$$

where k is a positive integer,  $a_0, a_1, \ldots, a_{k-1}$  are nonnegative integers less than b,  $a_{k-1} \neq 0$ , and

$$n = a_{k-1}b^{k-1} + \dots + a_1b + a_0$$

Notice: The base b expansion of a positive integer n is a string over the alphabet  $\{x \in \mathbb{N} \mid x < b\}$  whose leftmost character is nonzero.

Base $b$	Collection of possible coefficients in base $b$ expansion of a positive integer
Binary $(b=2)$	(n. 1)
$\frac{\text{Dinary } (0-2)}{}$	$\{0,1\}$
Ternary $(b=3)$	$\{0, 1, 2\}$
Octal $(b=8)$	$\{0, 1, 2, 3, 4, 5, 6, 7\}$
Decimal $(b = 10)$	$\{0, 1, 2, 3, 4, 5, 6, 7, 8, 9\}$
Hexadecimal $(b = 16)$	$\{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F\}$
	letter coefficient symbols represent numerical values $(A)_{16} = (10)_{10}$
	$(B)_{16} = (11)_{10} (C)_{16} = (12)_{10} (D)_{16} = (13)_{10} (E)_{16} = (14)_{10} (F)_{16} = (15)_{10}$

#### Base expansion examples

Binary $b = 2$	Octal $b = 8$	Decimal $b = 10$	Hexadecimal $b = 16$
$(1401)_2$			
(1401)2			
	$(1401)_8$		
	(1101)8		
		$(1401)_{10}$	
		7-4	
			$(1401)_{16}$

# Algorithm definition

New! An algorithm is a finite sequence of precise instructions for solving a problem.

#### Division algorithm

The Division Algorithm Let n be an integer and d a positive integer. There are unique integers q and r, with  $0 \le r < d$ , such that n = dq + r. In this case, d is called the divisor, n is called the dividend, q is called the quotient, and r is called the remainder. We write q = n div d and r = n mod d.

Extra example: How do div and mod compare to / and % in Java and python?

# Algorithm log

	Algorithm for calculating integer part of log	n	r	n > 1?
	Algorithm for calculating integer part of log	6		
1	procedure log(n: a positive integer)			
2	r := 0	l		
3	while $n > 1$			
4	r := r+1			
5	$n := n \operatorname{\mathbf{div}} 2$			
6	<b>return</b> $r$ { $r$ holds the result of the log operation}			

#### Base expansion algorithms

#### Two algorithms for constructing base b expansion from decimal representation

**Algorithm 1**: Start with highest power of b, i.e. at left-most coefficient of expansion

# Calculating integer part of $\log_b$ procedure logb(n,b): positive integers with b>1) while n>1 r:=r+1 n:=n div breturn r {r holds the result of the log operation}

```
Calculating base b expansion, from left

procedure baseb1(n,b): positive integers with b>1)

v:=n

k:=logb(n,b)+1

for i:=1 to k

k:=k-1 to k

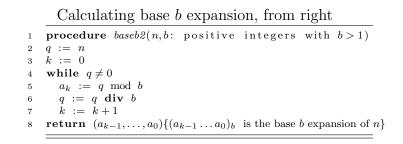

while v \ge b^{k-i}

k=k-i k=k-i k=k-i

return (a_{k-1},\ldots,a_0)\{(a_{k-1}\ldots a_0)_b \text{ is the base } b \text{ expansion of } n\}
```

#### Algorithm 2: Start with right-most coefficient of expansion

n	b	q	k	$a_k$	$q \neq 0$ ?

Idea: (when 
$$k > 1$$
)  $n = a_{k-1}b^{k-1} + \cdots + a_1b + a_0 = b(a_{k-1}b^{k-2} + \cdots + a_1) + a_0$  so  $a_0 = n \mod b$  and  $a_{k-1}b^{k-2} + \cdots + a_1 = n \operatorname{\mathbf{div}} b$ .

Algorithm 1 for the base 3 expansion of 17

Algorithm 2 for the base 3 expansion of 17
